IFET (TITUS) GREAT

AI-Native Backend Engineer | AI Systems | Full-Stack Web Development
Lagos, Nigeria | greatifet12@gmail.com | +234 904 722 6729 | github.com/knight-dev01 | linkedin.com/in/ifet-great-25844a248

PROFILE

First Class Computer Science graduate (CGPA 4.88/5.00, Trinity University Yaba, Lagos) and Backend AI Engineering Intern at FlyRank AI. Experienced designing and shipping production REST APIs, authentication systems, scheduled background services, and cloud-deployed applications using Python, FastAPI, Django, PostgreSQL, and TypeScript. Has independently built and deployed multiple full-stack systems from scratch, including ADIPHAS (a multi-service disease intelligence platform) and CMart (a full-stack e-commerce marketplace with a Django REST Framework backend). Active open-source contributor with 267 GitHub contributions in the past year, including contributions to the SafeRoute community safety platform by PyData Lagos.

EDUCATION

B.Sc. Computer Science *2021 – 2026*
Trinity University, Yaba, Lagos

- First Class Honours | CGPA: 4.88 / 5.00
- Final Year Project: Design and Development of an Autonomous Disease Intelligence and Public Health Advisory System (ADIPHAS)

(See more in PROJECTS section under ADIPHAS)

PROFESSIONAL EXPERIENCE

Backend AI Engineering Intern | **FlyRank AI** *Jun 2026 – Present*
Remote

- Build and maintain backend AI pipelines for organic-growth and AI-search automation workflows in a live production environment.
- Develop, test, and debug REST API endpoints; identify and resolve production issues across the service layer.
- Work with senior engineers on backend architecture decisions, service design, and cloud deployment processes.

Computer Systems & Networking Admin (SIWES) | **Inspire Polytechnic Lagos** *Feb 2025 – Aug 2025*
On-site, Lagos

- Administered computer systems, network infrastructure, and lab resources across a multi-lab institutional environment.
- Provided technical support to staff and students; performed system maintenance and reduced recurring downtime across campus labs.
- Designed and documented a Star LAN topology using office-model simulation; delivered as a formal technical project.

Assistant Software Developer Intern | **Citanuvola** *Aug 2023*
Hybrid, Ikeja

- Contributed to a Flutter mobile application integrating live company-asset APIs, working on backend wiring and data integration.
- Participated in code reviews and sprint cycles within an Agile cross-functional development team.

TECHNICAL SKILLS

Languages	Python, TypeScript, JavaScript, SQL, PHP, HTML, CSS
Backend	FastAPI, Django REST Framework, Node.js, REST API design, JWT Auth, OAuth 2.0, bcrypt, background scheduling, API integration, Pydantic, middleware
Frontend	React 18, Next.js 14, Vite, Tailwind CSS, PWA, dark mode, SPA routing, Motion (Framer Motion)
Databases	PostgreSQL, MySQL, SQLite, Firebase Firestore, Neon PostgreSQL — schema design, security rules, query optimisation, migrations

Cloud & Deploy	Render, Vercel, Railway, Streamlit Cloud, Google Cloud, AWS (foundational), Firebase Hosting
Auth & Security	JWT, OAuth 2.0, Google OAuth, Firebase Auth, bcrypt, CORS, HSTS, XSS protection, rate limiting
AI & NLP	Gemini API, OpenRouter, spaCy, Dempster-Shafer evidence fusion, multi-model fallback chains, LLM orchestration
Tools	Git, GitHub, Linux, Docker (foundational), GitHub Actions, Agile/Scrum, drf-spectacular (OpenAPI), Swagger UI

PROJECTS

ADIPHAS — Autonomous Disease Intelligence & Personal Health Advisory System | Python · FastAPI · PostgreSQL · NLP · Streamlit · Render

- Designed and built the complete backend service from scratch: modular REST endpoints, JWT-secured authentication, bcrypt password hashing, email verification flows, and a secure forgot-password recovery system.
- Implemented a multi-threaded autonomous background scheduler that scrapes news sources, processes content through spaCy and Gemini 2.5 Flash NLP pipelines, and dispatches tailored health briefings (Community and Expert variants) every 2 hours.
- Applied Dempster-Shafer Theory of Evidence to mathematically reconcile signals from formal IDSR (Integrated Disease Surveillance and Response) reports and informal EBS (Event-Based Surveillance) news feeds, enabling reliable outbreak detection in noisy, conflicting data environments.
- Built a 25-model OpenRouter fallback chain with exponential backoff so AI capabilities remain available within free-tier rate limits; implemented a modular model_config.py controlling the entire rotation.
- Deployed FastAPI backend on Render and Streamlit frontend on Streamlit Cloud; used Neon PostgreSQL in production with automatic SQLite fallback for local development; configured keep-alive cron jobs to maintain Render free-tier uptime.
- Implemented browser-native HTML5 Geolocation to anchor users to their Local Government Area (LGA) for hyper-local outbreak alerts; built a lazy-loading micro-frontend architecture using Streamlit fragments for fast page rendering under heavy AI computation.
- **GitHub:** github.com/knight-dev01/ADIPHAS
- **Live (Frontend):** adiphas.streamlit.app
- **Live (Backend API):** adiphas.onrender.com

CMart — Full-Stack Digital Student Marketplace | Django 6 · DRF · Next.js 14 · TypeScript · PostgreSQL · JWT · Railway · Vercel

- Built a full-stack multi-vendor student marketplace with a Django REST Framework backend: custom user model, JWT authentication with automatic token refresh, vendor application workflow, product CRUD with likes and categories, in-app chat, real-time notification signals, and order management.
- Implemented production-grade security: rate limiting (30 req/min anonymous, 120 req/min authenticated), CORS locked to frontend origin, HSTS, XSS filter, content-type sniffing protection, and Django password validators.
- Generated full OpenAPI 3.0 documentation via drf-spectacular; live Swagger UI and ReDoc available at /api/schema/swagger-ui/ and /api/schema/redoc/.
- Built Next.js 14 App Router frontend in TypeScript with React Context managing auth, cart, theme, and notifications; used vanilla CSS with CSS variables and glassmorphism styling; implemented PWA-ready architecture with bottom navigation for mobile.
- Deployed Django backend on Railway with PostgreSQL; Next.js frontend on Vercel; configured CORS and environment variables for cross-origin production deployment.
- **GitHub:** github.com/knight-dev01/CMart-Digital-Students-Martketplace
- **Live (Frontend):** c-mart-digital-students-martketplac.vercel.app

TU Market Hub — Multi-Vendor Student Marketplace | TypeScript · React · Firebase Firestore · Firebase Auth · Vite · Vercel

- Modelled Firestore data schemas and wrote security rules for multi-vendor product listings, cart drafts, vendor storefronts, and admin-only operations.
- Implemented Firebase Authentication with Google OAuth popup and role-based access control differentiating vendor dashboards from admin control panels.
- Built automated WhatsApp order-sheet generation: validates buyer inputs (hostel location, contact number), compiles pre-filled message templates, and routes orders directly to individual sellers via the WhatsApp API Gateway, removing in-app payment risk entirely.
- Deployed as a Progressive Web App on Vercel with SPA routing (vercel.json), progressive loading, full dark-mode support using Tailwind utility layers, and Motion (Framer Motion) micro-interactions.

- Includes an admin dashboard for category management, product listing control, global platform announcements, and database seeding.
- **GitHub:** github.com/knight-dev01/TU-Market-Hub
- **Live:** tu-market-hub.vercel.app

Aronee's Wears — E-Commerce Platform | TypeScript · React · Firebase · Tailwind CSS · Vercel

- Built a fully functional e-commerce storefront for a fashion brand: product catalogue, product detail views, vendor admin panel, OTP verification flow, and WhatsApp-integrated contact and order system.
- Implemented Firebase Authentication with OTP verification; built admin-only views gated by role-based access.
- Deployed on Vercel with PWA configuration, sitemap, and robots.txt for SEO.
- **GitHub:** github.com/knight-dev01/Aronee-s-Wears
- **Live:** aronee-s-wears.vercel.app

SafeRoute — Community Road Safety Platform (Open Source) | Python · FastAPI · PostgreSQL · React

- Contributor to SafeRoute, a community platform for reporting road safety incidents across Lagos, built by the PyData Lagos developer community.
- System allows commuters to anonymously report robberies, assaults, harassment, and roadblocks, making incident patterns visible to the wider community.
- Tech stack: FastAPI backend, PostgreSQL database, React frontend.
- **GitHub:** github.com/knight-dev01/SafeRoute

Candidate Capability Assessment API | Python · FastAPI · Pydantic

- Built a standalone FastAPI service that accepts a structured candidate profile and returns a scored capability assessment across three dimensions: Technical Competence, Professional Experience, and Leadership Potential.
- Used Pydantic models for strict request/response schema validation; implemented heuristic scoring algorithms normalised to a 0-10 scale per dimension with a synthesised overall score and seniority recommendation.
- Includes a full test suite (test_main.py) and auto-generated Swagger UI at /docs.
- **GitHub:** github.com/knight-dev01/VERITEX_TASK

Life Hierarchy Simulator & Priority Task Manager | Python · customtkinter · CLI

- Built a dual-interface Python application: a GUI RPG simulator using customtkinter with four distinct play modes (Story, Queue/Permadeath, Stack/Time-Travel, Classic), persistent XP tracking, and a leaderboard system.
- Built a companion CLI priority task manager enforcing a strict Maslow-inspired hierarchy: lower-tier tasks (Biological, Psychological) must be fully completed before higher-tier tasks are accessible.
- Packaged the GUI as a standalone Windows executable using PyInstaller via an automated build_universe.py script; released on GitHub as v1.0.
- **GitHub:** github.com/knight-dev01/Life-Hierarchy-Simulator-Built-In-Python

ML & Deep Learning Masterclass Workshop 2026 | Python · Jupyter Notebook · scikit-learn · TensorFlow

- Completed applied notebooks covering supervised regression, text classification, image classification, and data preprocessing as part of a structured ML/DL workshop.
- **GitHub:** github.com/knight-dev01/MACHING-LEARNING-DEEP-LEARNING-MASTERCLASS-WORKSHOP-2026

PHP & MySQL Academic Projects | PHP · MySQL · XAMPP · SQL

- Built a Polytechnic Database System and a Course Registration System using PHP and MySQL; implemented full CRUD operations, relational schema design, and session-based authentication.
- Projects developed during academic coursework; not publicly hosted but available for demonstration.

OPEN SOURCE & COMMUNITY

- 267 GitHub contributions in the past year across 12+ repositories.
- Active contributor to SafeRoute (PyData Lagos) — a community road safety reporting platform for Lagos commuters.
- Participated in ML/Deep Learning Masterclass Workshop 2026, completing regression, classification, and image recognition applied notebooks.

CERTIFICATIONS

- **Cyber Security Threats** — Great Learning

INTERESTS & FOCUS AREAS

- Backend system design and API architecture
- Fintech infrastructure and payment systems

- AI systems, LLM orchestration, and responsible AI
- Developer tooling and open-source software
- Urban technology and community safety platforms
